Development plan

Gain funding

Firstly, for Receipto to succeed, we need funding to be able to not only afford the server space, reaching out to businesses, systems integration with retailers, AI running costs and marketing but also to develop the app further with expertise and insight.

Plan features out

Each feature of the app needs to be thoroughly thought out and planned before we can start to develop it. This includes things like the idea itself, what features it has, how it impacts the rest of the app and much more.

Design

After planning the features out we then set about designing how they look and work. This includes designing the UI/UX of the feature and how to develop the feature.

Development

After the feature has been planned and designed, we can then start developing the idea to make a working prototype that users can interact with and use.

Test

Once the feature has been developed and a working prototype is delivered, we can then start to test it with real users and see how it works with the rest of the app. Here we must collect valuable data which we can use later on to see what does and doesn't work.

Review

Here we see if the feature works as intended and if the users gave good feedback. If it works and the feedback is good we can then deploy it into the app, but if it doesn't work as planned then we go back to the start and try again but with more insight.

Deploy

If the feature works as intended and is liked amongst the users, then it gets pushed to the next app update and becomes a working feature.
